PROGRAMMING LANGUAGES PARADIGMS

Project 1: Descriptive HTML

| Name:	ID:
Karim Alaa MoheyElDin	19016172
Mahmoud Ebrahim Gad Abo Alwafa	19016532
Yosef Ashraf Yosef Ibrahim	19016910

● Before running:

To run the application/unit tests, you have to specify the project path in the current directory class, so it can be used in file reading and writing.

The figures below show the location of "CurrentDirectory.java" and an example of the path of the project "HtmlParser".

```java
public class CurrentDirectory {
    //TODO add project absolute path
    final static public String PATH = "E:\\HtmlParser\\";
}
```

● Unit Testing:

Test Cases 1 ~ 5:

These tests compare the generated html from the program with expected html of a given input.

They produce the html file "output.html" which can be opened by the browser.

Test Cases 6 ~ 15:

These tests examine the sanity of the validation process.

● Assumption:

The program terminates if given "E" as input.
